Semantic Grouping Lab

Semantics are a simple concept so this will be a simple lab. As of now we have a ton of <div>s. We're going to refactor them to semantic tags instead.

Adding sections to all pages

1. In both landing.html and details.html, you have a header div. Change that to a <header>. You also have a footer div. Change that to a <footer>. The <div> in the middle that contains our main content should be a <main>.

2. Go through all of the other <div>s with your partner(s) and evaluate each one. Decide among yourselves what is the best semantic tag to choose from. Remember you have these available:

section	header
nav	footer
article	main
aside	

3. Also remember that there is no absolute right and wrong answers for which tags should be used. Instead, there are fuzzy choices where there may be disagreements among the team members. Make your best choices and call it done. ☺

4. After you've refactored them, run and test. You should see no differences in your pages after the refactoring. But your html is now cleaner, more accessible for users who have physical and mental challenges, and more indexable by search engines so they'll show up higher in search results.
